10 **4 Abstract**
11

12 **Introduction:** The debut of allogeneic cellular products makes the field of cell and gene therapy
13 (CGT) heavily dependent on healthy donors providing hematopoietic stem cells (HSCs). This
14 change in landscape will introduce new ethical quandaries for stem cell donors as their role
15 evolves with the introduction of stem cell donation for CGT research and development (R&D).
16 The objective of this study is to explore prospective donors' attitudes and perceptions towards
17 donating cells for novel treatments R&D.
18
19
20
21
22
23
24
25

26 **Methods:** A survey was launched in 2019 targeting prospective donors on a UK unrelated blood
27 stem cell donor register. The survey reported on participants' demographics, willingness towards
28 donating HSCs for novel treatment research, and degree of comfort with the donor registry
29 collaborating with and receiving payment from external organizations. A total of 20,000
30 potential participants were contacted. The survey was open for completion for two weeks
31 between January and February 2019. Data analysis was performed using SPSS software (version
32 28.0.1.1). Moreover, 94 participants provided qualitative responses, which expanded upon and/or
33 explained their quantitative responses.
34
35
36
37
38
39
40
41
42
43

44 **Results:** In total, 2440 prospective donors responded to the survey. Most participants (87%)
45 indicated they would be willing if approached to donate for research and novel treatment
46 development. Most participants were comfortable with the donor registry collaborating with
47 external organizations (91%) and with the donor registry receiving payment (80%). Participants'

1
2
3 23 qualitative responses mapped on topics such as trust, informed consent, transparency, privacy,
4
5 24 and commercialization.
6

7 25 **Discussion:**

8
9
10 26 The results are consistent with other studies in the literature assessing donors' willingness to
11
12 27 donate blood for biobanking and embryos for stem cell research. A hierarchy of donation
13
14 28 purposes emerged based on participants' responses, whereby therapeutic donations for patients in
15
16 29 need take precedence over donations for R&D. This could be a consequence of current
17
18 30 recruitment models to attract donors. In addition, it was evident that donors experience a moral
19
20 31 obligation and keenness to influence the direction of any donations made. As advancement in the
21
22 32 field may precede official regulatory guidance, donor organizations engaging in CGT should
23
24 33 practice self-regulation to ensure the sourcing and supplying of donor cellular material to the
25
26 34 commercial sector is conducted within a framework that safeguards donors' needs and
27
28 35 wellbeing.

42 40 **Introduction**

43
44 41 Three decades of ongoing stem cell research and their potential use to cure human diseases and
45
46 42 injuries have given rise to a transformative new category of therapeutics known as cell and gene
47
48 43 therapies (CGT)[1]. The CGT industry is on a fast-tracked path towards successful translation
49
50 44 into clinical practice. Several therapies, predominantly for haematological and
51
52 45 immunodeficiency diseases, have already been authorized for clinical use [2]. Moreover, there is
53
54
55
56
57
58
59
60

1
2
3 46 a vast pipeline of developments for CGT to treat cardiovascular, neurological, and
4
5 47 musculoskeletal diseases [3]. Globally, 1,340 clinical trials on CGT were taking place by the end
6
7 48 of June 2022 [4]. In the UK, the number of CGT clinical trials is on the rise, with 168 ongoing
8
9 49 trials in 2021, a 9% increase from 2020 [5]. In parallel, initiatives have been established to
10
11 50 accelerate patient access to these therapies. In 2021, over 5000 individuals across the NHS and
12
13 51 the industry received training in the delivery of advanced therapies to patients, including CGT
14
15 52 [5].
16
17
18
19
20
21

22 54 The debut of allogeneic cellular products offers the potential to retrieve products in quantities
23
24 55 that may be unattainable from autologous sources [6]. This makes the development of allogeneic
25
26 56 CGT heavily dependent on healthy donors providing hematopoietic stem cells (HSCs).
27
28 57 Consequently, the rapid growth of the CGT industry places stem cell donor registries under
29
30 58 significant pressure to adapt. This is critical as such a transition introduces complex issues that
31
32 59 might have several implications. First, the change in landscape will give rise to new ethical
33
34 60 dilemmas as the conventional role of stem cell donors evolves with the introduction of HSCs
35
36 61 donation for CGT research and development (R&D). Second, in order for advancements in CGT
37
38 62 to continue, donor registries must be able to meet the increased demand of the CGT industry for
39
40 63 HSCs without disrupting the existing donation structure for transplant patients. Third, sourcing
41
42 64 and supplying donated HSCs entails a need for partnerships between stem cell donor registries
43
44 65 and external organizations in the CGT industry. Partnerships could take place with
45
46 66 pharmaceutical companies, universities, or other public and private institutions and could result
47
48 67 in exchange of payment.
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 69 These emerging topics are likely to influence stem cell donors when making their decisions to
4
5 70 donate, making donor involvement a key parameter to consider. For example, research into
6
7 71 donors' attitudes on donating biospecimens for biobanking and stem cells for induced pluripotent
8
9 72 stem cell (iPSC) research recognizes altruism as the principal motivating factor to donate [7, 8].
10
11
12 73 Yet, some donors demonstrate concerns over donating stem cells and biospecimens for R&D
13
14 74 purposes [8]. This is particularly prominent when research bodies associate with and receive
15
16 75 funding from for-profit organizations [9]. Under such circumstances, donors exhibit concerns
17
18 76 over privacy of genetic material, disclosure of information during informed consent, and
19
20 77 commercialization [8-10]. Yet, trust seems to be a key influencer in guiding these views (Table
21
22 78 1). Public trust is essential in fostering public engagement and encouraging donation [11].
23
24
25 79 Consequently, the wellbeing of donors and the potential for harm and exploitation within this
26
27 80 new paradigm of donation practice are key issues for stem cell donor registries to consider.
28
29 81 Trusted donor organizations and stem cell registries must carefully determine how to navigate
30
31 82 this transition without risking the disruption of the trust-based relationship with prospective
32
33 83 donors. In order to achieve that, it is essential to understand prospective donors' perspectives on
34
35 84 the sourcing of their stem cells by donor registries to external organizations for CGT
36
37 85 development. Accordingly, a survey was launched in 2019 by Anthony Nolan (AN), a UK
38
39 86 charity and stem cell donor registry facilitating life-saving stem cell donations from volunteer
40
41 87 donors. The survey aimed to explore prospective donors' willingness to donate HSCs for novel
42
43 88 treatment R&D and their degree of comfort with AN collaborating with and receiving payment
44
45 89 from external organizations. In January 2019, there were 690,000 active donors on the AN
46
47 90 register.

91

92 Table 1. Overview of ethical concerns related to stem cell donation for research and**93 biobanking****94 Methods:****95 Sample selection**

96 The population of interest included prospective donors on the AN unrelated donor register in the
97 UK. Donors are accepted on to the AN register from 16 years of age and remain on the register
98 until they are 60 years of age. Approximately 20,000 people on the register were contacted with
99 the aim for a response rate of 2,000. The 20,000 people contacted were selected from the AN
100 register, specifically from those who had opted into such communications from AN. A stratified
101 sample was obtained using Alteryx, a data analytics tool, ensuring that donors from diverse
102 geographical regions, ages, ethnicity, and gender were selected. In total, data was collected from
103 2440 registered prospective donors.

104

105 Survey design and administration

106 An email with a link to the digital survey and to the AN website was sent out informing potential
107 participants about the research and the opportunity to complete the survey. A reminder email
108 was sent out one week later. The survey was open for completion online for a period of two
109 weeks during January and February 2019. The project received approval from Research Ethics
110 Committee at [REDACTED]

111

112 Measures

1
2
3 113 The measurement instrument for the survey was developed in accordance with the guidelines of
4
5 114 the FHM REC. To ensure comprehensibility, the draft survey was piloted by 10 volunteers on
6
7 115 the AN Donor Panel who were invited to participate and selected to match the demographics of
8
9 116 potential participants in the study. The measures of the survey assessed prospective donors'
10
11 117 willingness to donate cells to be used for research towards developing new therapies, and their
12
13 118 degree of comfort with AN collaborating with external organizations and receiving payment
14
15 119 from these organizations. The survey constituted 21 items including the above-mentioned
16
17 120 variables in addition to prospective donors' demographics. All the items used were closed-ended
18
19 121 questions, except for the final item, which allowed participants to leave any comments they had
20
21 122 about the survey. Items in the survey were scored either using nominal scales or ordinal scales.
22
23 123 Demographics were assessed using multiple-choice questions. Sample items from the survey are
24
25 124 provided in Appendix 1. The STROBE guidelines for reporting observational studies were
26
27 125 followed [13].
28
29
30
31
32

126

127 **Data analysis**

33
34
35
36
37 128 Arrangement and cleaning of data was performed on Microsoft Excel. Data entry and analysis
38
39 129 was performed using SPSS software (version 28.0.1.1). Descriptive statistics are reported for
40
41 130 categorical variables. Comparison between participants' demographics and their willingness to
42
43 131 donate for R&D, degree of comfort with AN collaborating with external organizations, and
44
45 132 degree of comfort with receiving payment was performed using Chi-square testing for
46
47 133 independence. A p-value of less than 0.05 was considered statistically significant. Participants
48
49 134 were not encouraged to leave comments related to the survey. However, 94 participants provided
50
51
52
53 135 qualitative responses which expanded upon and/or explained their quantitative responses. The
54
55
56
57
58
59
60

1
2
3 136 qualitative data was themed according to overarching broad topics. These topics mapped on
4
5 137 participants' reasons for donation, concerns over donation, and facilitators of donation for CGT
6
7
8 138 research and development.
9

10 139

12 140 **Results**

14 141 **Demographic characteristics**

16
17 142 The total number of participants was 2362 after missing values were removed from the data,
18
19 143 achieving the expected response rate. Of these participants, (67%) were females and (33%) were
20
21 144 males. Most participants were between 21 and 40 years of age, (14%) were over 51 years old.
22
23 145 The overwhelming majority of respondents were white British (94%). Over half (52%) of
24
25 146 participants were classified as having higher education, defined as attaining any undergraduate or
26
27 147 graduate degree, whereas (48%) of participants reported high school level education. Most
28
29 148 participants (86%) were in some form of employment, including self-employment or voluntary
30
31 149 work (Table 2).
32

44 154

45
46
47 155 Most participants (87%) indicated they would be willing if approached to donate HSCs for novel
48
49 156 treatment research and development. Those who were uncertain about whether they would be
50
51 157 willing to donate constituted 12% and only 1% were unwilling to donate. Among the participants
52
53
54 158 who were unsure of their willingness to donate, 92% were comfortable with the AN
55
56
57
58
59
60

1
2
3 159 collaborating with external organizations and 85% were comfortable with AN receiving payment
4
5 160 from external organizations. There was no statistically significant association between
6
7 161 participants' age, gender, and ethnicity and their willingness to donate for CGT development (p
8
9 162 value = 0.713, 0.345 and 0.807, respectively). A statistically significant association was present
10
11 163 between participants' willingness to donate for R&D and education level (p value = 0.011).
12

14
15 187 **organizations**

16
17
18
19 188
20
21 189 **Qualitative responses**

22
23 190 For some participants, the desire to help for the benefit of others was the main motivating factor
24
25 191 behind their willingness to donate HSCs for R&D of novel therapies. Collaboration with external
26
27 192 organizations was viewed positively and was considered as a step forward for AN to improve the
28
29 193 overall health and quality of life of others. While some participants demonstrated keenness to
30
31 194 donate HSCs for R&D unconditionally, others constructed a hierarchy of donation purposes.
32
33 195 Some participants had concerns over infringement of privacy, especially if external
34
35 196 collaborations with third parties like pharmaceutical companies were to take place. Others
36
37 197 conveyed apprehensions over their donations leading to profiteering and expressed worry that
38
39 198 this might compromise universal access to healthcare and lead to overpriced treatments.
40
41
42
43

44 199
45
46 200 Participants suggested that informed consent and transparency over the nature of collaborations
47
48 201 could relieve some of their concerns. Finally, some responses conveyed a sense of distrust
49
50 202 amongst participants towards collaboration with pharmaceutical companies. In contrast, a great
51
52 203 deal of trust was instilled with regards to AN, and it seemed that this degree of trust alleviated
53
54 204 some of the worries participants expressed concerning partnerships with external organizations.
55
56
57
58
59

5 206 **Table 5. Summary of emerging themes underlying participants' reasons for donation,**
6
7
8 207 **concerns over donation, and facilitators of donation for cell and gene therapy research and**
9
10 208 **development**

11
12
13 209 **Discussion:**

14
15 210 The overwhelming majority (87%) of prospective donors were in support of donating HSCs for
16
17 211 novel treatment R&D. The results are consistent with other studies in the literature assessing
18
19 212 donors' willingness to donate blood for biobanking and embryos for stem cell research [7, 14].
20
21 213 Some participants would donate stem cells for CGT development only if these cells were a by-
22
23 214 product of the primary purpose of donation. Others demonstrated willingness to donate for CGT
24
25 215 development only at an age when their stem cells are no longer viable for the treatment of
26
27 216 patients. Underlying these responses is a hierarchy of donation purposes, whereby therapeutic
28
29 217 donations for patients in need take precedence over donations for R&D. While most participants
30
31 218 were amicable to HSCs donation for R&D purposes, some responses suggest current donors are
32
33 219 relatively unacquainted with this purpose of donation. Generally, donor recruitment
34
35 220 organizations approach eligible donors through campaigns that primarily appeal to the public and
36
37 221 potential donors' sense of altruism and beneficence [15, 16]. Perhaps donors' construction of a
38
39 222 hierarchy of value is a consequence of current recruitment models employed by donor
40
41 223 organizations and stem cell registries to attract donors. Under such assumptions, stem cell donor
42
43 224 registries could explore how changing the recruitment journey for donors (through the
44
45 225 introduction of HSCs donation for CGT R&D in recruitment initiatives) may influence donors'
46
47 226 current perceptions on the different purposes of HSCs donation.
48
49
50
51
52
53
54
55 227

1
2
3 228 A substantial number of participants felt comfortable with AN collaborating with external
4
5 229 organization for the development of new therapies. Similarly, most participants were
6
7 230 comfortable with AN receiving payment from external organizations. Nevertheless, many
8
9 231 participants raised several considerations that would factor in their decision-making as
10
11 232 prospective HSCs donors for CGT R&D (Figure 1). First, the involvement of external
12
13 233 organizations was coupled with apprehensions related to privacy and security of genetic material,
14
15 234 further substantiating the well-documented donor concerns over the risk of reidentification and
16
17 235 the potential for discrimination based on retrieved genetic information [8]. Second, some donors
18
19 236 exhibited a moral responsibility to maintain universal access to healthcare when deciding to
20
21 237 donate and relayed concerns over collaborations leading to profiteering and inaccessible,
22
23 238 overpriced therapies. Such perceptions go in line with the effect of commercialization in the
24
25 239 context of stem cell research [17, 18]. This could be due to donors' fragmented trust towards
26
27 240 pharmaceutical companies compared with trusted donor organizations and their perceived beliefs
28
29 241 that commercial companies are not as altruistic in their endeavours as donor organizations might
30
31 242 be. The publication of a recent high-profile study delineating under-reporting of payments made
32
33 243 by pharmaceutical companies to patient organizations could further validate these concerns [19].
34
35 244 Nevertheless, many participants expressed a need for more information on the circumstances
36
37 245 surrounding these collaborations prior to deciding on how comfortable they are with the stem
38
39 246 cell donor registry partnering with external agencies.

40
41
42
43
44
45
46
47 247

48
49 248 Consequently, transparency is paramount to secure donors' trust in not just the donor
50
51 249 organization, but any possible collaborators. Full disclosure over the nature of the partnership
52
53 250 project, the payment process between the involved parties, and any potential commercial value
54
55
56
57
58
59
60

1
2
3 251 that might arise will allow prospective donors to be fully informed when making their donation
4
5 252 decisions. Further, donor organizations and stem cell registries should carefully consider
6
7 253 anonymity concerns when drafting policies and practices on supplying donated HSCs to the
8
9 254 private industry. Donors should be well informed on the General Data Protection Regulation
10
11 255 (GDPR). Under this law, genetic data is listed as sensitive personal information that can be
12
13 256 processed only if overt consent from the data subject has been obtained [20]. The above-
14
15 257 mentioned matters require consideration by donor organizations and stem cell donor registries
16
17 258 wishing to engage within the CGT industry. Donor organizations should practice self-regulation
18
19 259 to ensure the sourcing and supplying of donor cellular material to the commercial sector is
20
21 260 conducted within a framework that safeguards donors' needs and wellbeing. This is especially
22
23 261 important as advancement in the field may precede official regulatory guidance on the
24
25 262 facilitation of HSCs donation between donors and the commercial sector. Moreover, even though
26
27 263 the results present a positive response from prospective donors to collaboration and income
28
29 264 generation, stem cell donor registries need to consider how to meet the increased demand of the
30
31 265 industry for donated cellular products whilst continuing to facilitate life-saving stem cell
32
33 266 donations from volunteer donors.
34
35
36
37
38
39

40 267
41
42 268 Interestingly, most prospective donors' who were unsure of their willingness to donate for novel
43
44 269 treatment R&D were in favour of AN partnering with and receiving payment from external
45
46 270 establishments. This suggests that factors besides those raised in participants' responses may be
47
48 271 involved in the decision-making process for donors regarding donations for CGT. The most
49
50 272 common perceived incentive for HSCs donation among potential donors is the belief that
51
52 273 donations save lives, and donors possess the ability within themselves to help [21, 22]. These
53
54
55
56
57
58
59

1
2
3 274 beliefs represent the scaffolding by which the donor-recipient relationship is built and through
4
5 275 which it remains anchored. However, Diamond et al. discuss how relationships constructed
6
7
8 276 through donation can shift as the means and reasons for donations proliferate and become more
9
10 277 complex [23]. The advent of allogeneic therapies serves as a prime example of such change by
11
12 278 expanding the role of stem cell donors beyond its traditional boundary. Through the introduction
13
14
15 279 a new purpose of donation, allogeneic CGT blurs the direct link currently present between
16
17 280 donors and recipients. Understanding how this transformation is perceived by potential donors is
18
19 281 crucial for the CGT industry to continue its growth at pace.

22 282 **Implications for future policies and practices**

23
24 283 It was possible to gain insight into the perceptions of some prospective donors on pharmaceutical
25
26 284 companies, and the disparities that surface when comparing donors' views on private
27
28 285 establishments versus trusted donor organizations. It was also evident that some donors
29
30 286 experience a moral obligation and keenness to influence the direction of any donations made.
31
32
33 287 Accordingly, it would be worthwhile to disentangle donors' perceptions surrounding the private
34
35 288 sector and gain deeper insight into what is deemed to be 'ethical' engagement between trusted
36
37
38 289 donor organizations and commercial institutions. Further inquiry into donors' perceptions on
39
40 290 donation for CGT R&D is necessary to construct ethical policies and outline donation practices
41
42 291 that ensure the safety and welfare of donors. Now is the time to reform the regulatory agenda and
43
44 292 ensure donors are at the forefront of issues in need for consideration within this budding field.

46
47 293

49 294 **Limitations**

50
51 295 It is worthy to note the timing of the data collection in relation to the COVID-19 pandemic. The
52
53
54 296 role pharmaceutical companies played in the recent pandemic could result in a shift in

1
2
3 297 perceptions and attitudes of prospective donors. For example, a recent study published by the
4
5 298 Association of the British Pharmaceutical Industry revealed a 24% increase in the public's
6
7
8 299 positive views of the industry since the pandemic [24]. It is therefore possible that a similar shift
9
10 300 in perceptions may be present amongst prospective donors today. Another limitation of findings
11
12 301 is related to the sample population. Most participants were white British and minority groups
13
14 302 were scarcely represented. This reflects the general under representation of minority groups in
15
16 303 stem cell donor registries and could therefore bias the results of this survey. Nevertheless, we
17
18 304 believe the sample size of this study along with the sample selection method ensure
19
20 305 generalisability as the range of participants was wide; both males and females ranging across
21
22 306 several age groups and educational backgrounds were included, and all major outcomes were
23
24 307 represented.
25
26
27
28
29
30

309 **Consent statement**

310 Informed consent was obtained from all individual participants in this project. The project
311 received approval from the Research Ethics Committee at the Faculty of Health and Medicine
312 (FHM REC) at [REDACTED]

313

314 **Data availability**

315 Data is not available due to ethical restrictions. Due to the nature of this study, participants were
316 recruited on the basis of informed consent and did not agree for their data to be shared publicly.
317 Permission was not requested to share data when submitting the ethical approval form because of
318 the commercial sensitivity around the aims and objectives of the wider research study and the
319 resulting data analysis. We therefore are unable to deposit the data in a repository.

Table 1. Overview of ethical concerns related to stem cell donation for research and biobanking

Ethical concern	Context under which ethical concerns emerge	Reference
Trust	<ul style="list-style-type: none"> • Among the public, trust in university-funded research on preserved stem cells in biorepositories is high but decreases when researchers associate with private, for-profit institutes. • Collaborations with private preservation enterprises may be viewed by the public as a compromise to public/academic institutes' commitment to their mission of public service and would lead to a loss of trust in public/academic sectors. 	Master, Z. et al. [9]
Informed consent	<ul style="list-style-type: none"> • Consent emerges in relation to subsequent commercialization of products and therapies that result from research on biobank samples. Consent as an ethical concern is also prominent when financial support by private bodies is provided to public biobanks, especially when this type of funding has not been attended to in the initial consent process. 	Caulfield T. et al. [10]

Privacy	<ul style="list-style-type: none">• The potential for genetic health information leading to reidentification is associated with great concern for iPSC donors. This concern relates to the possible risk of discrimination and stigmatization such information may lead to.• Involvement of private funders may aggravate privacy concerns for biobank participants. Participants may deem their privacy violated if data sharing were to take place with for-profit organizations, inevitably compromising the public's trust in biobanks.	Isasi R. et al. [12] Caulfield T. et al. [10]
Commercialization	<ul style="list-style-type: none">• Potential donors for iPSC research demonstrate concerns over the distribution of any resulting commercialized therapies. These concerns are demonstrated in the context of the immortalization of cell lines and the distribution of profit if therapies were to arise from them.	Dasgupta et al.[8]

Table 2. Characteristics of participants

Characteristics of the study sample (n=2362)	Percentage
Gender

Total	Count	2145	30	1891	84
	% Within Education Level	91%	1.4%	80%	3.6%

Table 5. Summary of emerging themes underlying participants' reasons for donation, concerns over donation, and facilitators of donation for CGT R&D

Themes	Participant quote
Altruism	<p>“I am very happy to donate my stem cells to anyone that needs them or for research.” (Female, aged 51+).</p> <p>“Very happy to participate in whatever way I could assist.” (Male, aged 51+).</p> <p>“I like to think that there is collaboration which is wider than the initial cause that AN set up for. To improve the health and quality of life for current and future individuals, research and utilizing current resources such as the database of donors is a part of this.” (Female, aged 40-51).</p>
Hierarchy of donation	<p>“I would be willing to allow some of the donation to be used if the majority of the donation was for a patient (i.e., the research sample was a by-product).” (Male, aged 40-51).</p> <p>“I’d be happy for my cells to be used for research with other companies provided that isn’t the sole reason they were obtained - I’d rather know they were directly being used to treat someone.” (Female, aged 21-30).</p> <p>“I would be happy to donate at an age where I would have to leave the register (so my cells are no longer viable for treating someone but hopefully still viable for research).” (Female, aged 21-30).</p> <p>“I appreciate the importance of research, but I feel strongly that I would not feel okay losing the ability to donate to someone when they need it.” (Female, aged 21-30).</p>

<p>1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16</p> <p>Privacy</p>	<p>“The only issue I would wish to be reassured on would be the security of data sharing between AN and other organisations and the appropriateness of any payments between the parties... this would extend to DNA profiling, personal information security etc.” (Male, aged 51+).</p> <p>“I would be happy if there was collaboration with third parties to save lives but would be concerned about third party data usage.” (Male, aged 21-30).</p>
<p>17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41</p> <p>Commercialization</p>	<p>“I wouldn’t participate if there was any profit going to pharmaceutical companies.” (Female, aged 31-40).</p> <p>“I feel comfortable about AN working with external organizations or receiving payment only if this doesn't compromise in any way, directly or indirectly, the affordability of treatments for everyone.” (Male, aged 21-30).</p> <p>“I do not object to AN working with pharmaceutical companies, and getting paid for providing stem cells from donors, to help people in need. I would object if the pharmaceutical companies, then made millions off those stem cells and people in need had to pay a high price for their treatment.” (Female, aged 51+).</p>
<p>42 43 44 45 46 47 48 49 50 51 52 53 54 55 56 57 58 59 60</p> <p>Transparency and Informed Consent</p>	<p>“I would feel more comfortable if payments made to AN were publicized and the purpose of them were made clear.” (Male, aged 21-30).</p> <p>“I would like to know more about how the money is used before I would feel comfortable with it.” (Male, aged 21-30).</p> <p>“This would be greatly affected by who the agency/company/charity is.... this worry would be allayed if there were clauses within the contract which</p>

	allowed the use of donations solely if the therapy developed from those was provided at a reasonable markup from cost.” (Male, aged 31-40).
Trust	<p>“I understand that provision of donations to third parties in exchange for money is a necessary evil...I hope some of your affiliates are also charitable organisations.” (Female, aged 20-31).</p> <p>“I would be more cautious without significant safeguards, about AN working or receiving money from pharmaceutical companies, compared to, say, other charities.” (Male, aged 51+).</p> <p>“I would be happy for AN to work with other organisations/be paid by them as long as it was for reasons that were compatible with what AN stands for...I trust AN to make ethical and fair choices in who they work with.” (Female, aged 21-30).</p>

Reporting checklist for cross sectional study.

Based on the STROBE cross sectional guidelines.

Instructions to authors

Complete this checklist by entering the page numbers from your manuscript where readers will find each of the items listed below.

Your article may not currently address all the items on the checklist. Please modify your text to include the missing information. If you are certain that an item does not apply, please write "n/a" and provide a short explanation.

Upload your completed checklist as an extra file when you submit to a journal.

In your methods section, say that you used the STROBE cross sectional reporting guidelines, and cite them as:

von Elm E, Altman DG, Egger M, Pocock SJ, Gotsche PC, Vandenbroucke JP. (von Elm, 2014 #45)

	Reporting Item	Page Number
Title and abstract		
Title	#1a Indicate the study's design with a commonly used term in the title or the abstract	1
Abstract	#1b Provide in the abstract an informative and balanced summary of what was done and what was found	1
Introduction		
Background / rationale	#2 Explain the scientific background and rationale for the investigation being reported	2-4
Objectives	#3 State specific objectives, including any prespecified hypotheses	4
Methods		
Study design	#4 Present key elements of study design early in the paper	5
Setting	#5 Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	5

1	Eligibility criteria	#6a	Give the eligibility criteria, and the sources and methods of	5
2			selection of participants.	
3				
4				
5		#7	Clearly define all outcomes, exposures, predictors, potential	5-6
6			confounders, and effect modifiers. Give diagnostic criteria, if	
7			applicable	
8				
9				
10	Data sources /	#8	For each variable of interest give sources of data and details	6
11	measurement		of methods of assessment (measurement). Describe	
12			comparability of assessment methods if there is more than	
13			one group. Give information separately for for exposed and	
14			unexposed groups if applicable.	
15				
16				
17				
18	Bias	#9	Describe any efforts to address potential sources of bias	5
19				
20				
21	Study size	#10	Explain how the study size was arrived at	5
22				
23	Quantitative	#11	Explain how quantitative variables were handled in the	6
24	variables		analyses. If applicable, describe which groupings were	
25			chosen, and why	
26				
27				
28	Statistical	#12a	Describe all statistical methods, including those used to	6
29	methods		control for confounding	
30				
31				
32	Statistical	#12b	Describe any methods used to examine subgroups and	6
33	methods		interactions	
34				
35				
36	Statistical	#12c	Explain how missing data were addressed	7
37	methods			
38				
39				
40	Statistical	#12d	If applicable, describe analytical methods taking account of	n/a
41	methods		sampling strategy	
42				
43				
44	Statistical	#12e	Describe any sensitivity analyses	n/a
45	methods			
46				
47				
48	Results			
49				
50	Participants	#13a	Report numbers of individuals at each stage of study—eg	7
51			numbers potentially eligible, examined for eligibility,	
52			confirmed eligible, included in the study, completing follow-	
53			up, and analysed. Give information separately for for	
54			exposed and unexposed groups if applicable.	
55				
56				
57				
58	Participants	#13b	Give reasons for non-participation at each stage	n/a
59				
60				

1	Participants	#13c	Consider use of a flow diagram	n/a
2				
3	Descriptive data	#14a	Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders. Give information separately for exposed and unexposed groups if applicable.	7
4				
5				
6				
7				
8				
9				
10	Descriptive data	#14b	Indicate number of participants with missing data for each variable of interest	n/a missing data removed
11				
12				
13				
14	Outcome data	#15	Report numbers of outcome events or summary measures. Give information separately for exposed and unexposed groups if applicable.	8
15				
16				
17				
18				
19	Main results	#16a	Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included	n/a
20				
21				
22				
23				
24				
25				
26	Main results	#16b	Report category boundaries when continuous variables were categorized	7
27				
28				
29				
30	Main results	#16c	If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	n/a
31				
32				
33				
34	Other analyses	#17	Report other analyses done—e.g., analyses of subgroups and interactions, and sensitivity analyses	9
35				
36				
37				
38	Discussion			
39				
40	Key results	#18	Summarise key results with reference to study objectives	10-11
41				
42	Limitations	#19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias.	13
43				
44				
45				
46				
47	Interpretation	#20	Give a cautious overall interpretation considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence.	12
48				
49				
50				
51				
52				
53	Generalisability	#21	Discuss the generalisability (external validity) of the study results	14
54				
55				
56				
57	Other			
58	Information			
59

Methods Reporting Checklist for Authors:

In accordance with the guidelines that emerged from a workshop led by the NIH, aimed at enhancing the scientific rigour and reproducibility of published results (accessed [here](#)), we have taken measures to ensure that we at [Future Science Group](#) are promoting good reporting standards. The checklist below is designed to establish if you have fulfilled the standards required by our journals.

Please check the below and indicate if the following information is available in your manuscript (or supplementary material). In cases where you have confirmed that the stipulated information is present in your article, please detail where it can be found by providing the page/paragraph/line number. If you feel that inclusion of this information is not applicable to your study, please indicate this in the column titled N/A.

For types of studies not covered by the methods checklist below, we recommend you consult the [Equator Network](#) website to identify a suitable guideline.

<u>General Methods</u>	Yes – information is located on page/paragraph/line:	N/A
1. I have detailed the exact sample size (<i>n</i>) for each experimental group/condition, as a number, not a range	7/2/142	
2. I have explained how sample size was chosen (in terms of having enough statistical power to make inferences about the sample)	5/1/96	
3. For animal studies, I have included a statement about sample size estimate (NB. applicable even if no statistical methods were used)		n/a
4. A description of the sample collection is included, enabling the reader to understand whether the samples represent technical or biological replicates (including how many animals, litters, culture, etc.)		n/a
5. I have defined how many times the experiment was replicated		n/a
6. I have detailed inclusion/exclusion criteria in cases where samples or animals were excluded from the analysis. I have detailed if the criteria were pre-established		n/a

Methods Reporting Checklist
Version: 15th January 2019

7. I have clarified the method of randomization that was used to determine how samples/animals were assigned to experimental groups	5/1/101	
8. For animal studies: I have included a statement detailing whether or not randomization was used		n/a
9. For animal studies: I have included a statement detailing whether or not blinding was done		n/a
10. I have stated the extent to which the investigator was blinded to the group allocation during the experiment and/or when assessing the outcome		n/a
<u>Statistical Testing</u>	Yes – information is located on page/paragraph/line:	N/A
1. Statistical methods and measures have been defined: There is no need to describe very common tests, but more complex techniques should be described in the methods section. (For small sample sizes (n<5) descriptive statistics are not appropriate, instead plot individual data points)	5/1/113	
2. I have stated if tests are one-sided or two-sided		n/a
3. Statistical test results have been included e.g., <i>P</i> values	6/2/133	
4. 'Center values', such as median or mean have been defined		n/a
5. Error bars (e.g., s.d. or s.e.m. or c.i.) have been defined		n/a
6. I have stated if the data meet the assumptions of the tests (e.g., normal distribution)		n/a

Methods Reporting Checklist

Version: 15th January 2019

- | | | |
|--|--|-----|
| 7. I have clarified if there is an estimate of variation within each group of data and, if so, I have detailed if the variance is similar between the groups that are being statistically compared | | n/a |
|--|--|-----|

Reagents

Yes – information is located on page/paragraph/line:

N/A

- | | | |
|---|--|-----|
| 1. I have provided evidence that the antibodies were profiled for use in the system under study (assay and species), by giving a citation, catalog number and/or clone number, supplementary information or reference to an antibody validation profile (e.g., Antibodypedia , 1DegreeBio) | | n/a |
|---|--|-----|

- | | | |
|---|--|-----|
| 2. I have clearly identified the source of cell lines and reported if they were recently authenticated (e.g., by STR profiling) and tested for mycoplasma contamination | | n/a |
|---|--|-----|

Animal Models[†]

Yes – information is located on page/paragraph/line:

N/A

- | | | |
|--|--|-----|
| 1. I have reported the species, strain, weight, sex and age of animals | | n/a |
|--|--|-----|

- | | | |
|---|--|-----|
| 2. For experiments involving live vertebrates: I have either ticked to indicate that the necessary protocols have been followed in the Author Disclosure form or I have included a statement of compliance with ethical regulations and identified the committee(s) approving the experiments in my paper | | n/a |
|---|--|-----|

[†] We recommend consulting the [ARRIVE guidelines](#) to ensure that other relevant aspects of animal studies are adequately reported.

Methods Reporting ChecklistVersion: 15th January 2019**Human Studies^{† ‡}****Yes – information is located on page/paragraph/line:****N/A**

1. I have identified the committee(s) approving the study protocol	5/2/109	
2. I have included a statement confirming that informed consent was obtained from all subjects/ indicated that this is the case in the Author Disclosure form	14/2/310	
3. I have reported the clinical trial registration number (at ClinicalTrials.gov or equivalent)		n/a

† For Phase II and III randomized controlled trials, we recommend that you refer to the [CONSORT statement](#).

‡ For tumor marker prognostic studies, we recommend that you follow the [REMARK reporting guidelines](#).

Data and material sharing[†]**Yes – information is located on page/paragraph/line:****N/A**

1. I have stipulated in the manuscript that all datasets on which the conclusions of the report rely are available on request	Data availability statement included 14/3/315	
2. I have provided accession codes for data that has been deposited in public repositories		n/a
3. If software has been used in the study: I have included information about the type of software and a statement describing if the software is available and how it may be obtained	6/2/128	

† We encourage the deposition of data to a discipline-specific, community-recognized repository where one exists, or a generalist repository if no suitable specific resource is available. Repositories can be found via sites such as re3data.org.

Health economic evaluations

Yes, see separate checklist:

N/A

1. I have followed the separate CHEERS[†] checklist, available [here](#).

n/a

† Husereau D, Drummond M, Petrou S *et al.*, on behalf of the CHEERS Task Force. Consolidated Health Economic Evaluation Reporting Standards (CHEERS) statement. *BMJ* 346, f1049 (2013).

Observational studies

Yes, see separate checklist:

N/A

1. I have followed the separate STROBE[†] checklist, available [here](#).

Yes, uploaded as supplementary information

† von Elm E, Altman DG, Egger M, Pocock SJ, Gotsche PC, Vandenbroucke JP. The Strengthening the Reporting of Observational Studies in Epidemiology (STROBE) Statement: guidelines for reporting observational studies. *BMJ*. 335(7624), 806–808 (2007).

Systematic reviews & meta-analyses

Yes, see separate checklist:

N/A

1. I have followed the separate checklist established by [PRISMA[†]](#), available [here](#).

n/a

† Moher D, Liberati A, Tetzlaff J, Altman DG, The PRISMA Group (2009). Preferred reporting items for systematic reviews and meta-analyses: the PRISMA statement. *BMJ* 339, b2535 (2009).
